

Debrief sheet

The study that you just took part in investigated whether the effect of birth order, immigration background, and gender on mental well-being. Previous studies have found first-borns to have lower mental well-being than later-borns. Possible mechanisms include that having older siblings gives way to more early social interactions that promote thought regulation, emotion regulation, as well as prosocial behavior. First-borns may also experience greater family pressure and responsibilities, which could be exacerbated by immigration (cultural) background and gender roles. We hope that our findings can shed some more light on the sociocultural factors of mental well-being.

Thank you for your participation. Please do not hesitate to contact Viet-Hung Nguyen (vnguyen36@dons.usfca.edu) or Dr. Indre Viskontas (ivviskontas@usfca.edu) if you have any questions.
